DETAILED ACTION

Continued Examination Under 37 CFR 1.114

1. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 04/09/2009 has been entered.

Claim Rejections - 35 USC § 103

- 2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 3. Claims 1-13, 52, 53, and 60-70 are rejected under 35 U.S.C. 103(a) as being unpatentable over Takehiro et al. (U.S. 6,403,441 B1, hereinafter Takehiro) in view of Dornfest et al. (U.S. 6,358,810 B1, hereinafter Dornfest).

In reference to claims 1 and 3, Takehiro (Figs.2d, 4a and 4b) discloses a substrate assembly, comprising a support surface (6); and a plurality of high-K dielectric layers (9, 10, 11) over said support surface, wherein a common metal is present in said layers of said plurality (9, 10, 11), and wherein one of the layers has a higher concentration of oxygen defined by point A (Takehiro Fig.4b) than an underlying layer,

defined by point B (Takehiro, Fig.4b), wherein said plurality high-k dielectric layers (9, 10, 11) further includes an oxygen barrier layer (10) that prevents oxides of the support surface (6) and wherein the invention may be carried out in any semiconductor device as long as it has a capacitor structure that employs a highly dielectric film as an insulating film (Takehiro, column 4, lines 46 – 54, column 6, line 16 – column 8, line 27 and column 16, lines 29 – 35).

Takehiro fails to expressly dislcose wherein one layer of the plurality of high-k dielectric layers manifests greater oxidation than would an equivalent thickness of an underlying layer of the plurality.

However, the recitation of "greater oxidation" is seen to be a recitation of a dielectric layer of said plurality of layers having a higher concentration of oxygen with respect to another layer of said plurality. Therefore, Takehiro teaches the claimed limitation because Takehiro discloses an overlying dielectric layer having a higher concentration of oxygen.

Still, Takehiro fails to disclose, wherein the support surface extends into a recesses formed in the substrate assembly.

However, Dornfest (Figs.1-4 and 6) discloses a substrate assembly including a support surface (54, 56, 58, 60); a high-k dielectric layer (62) over said support surface (54, 56, 68, 60); and a conductive layer (64) spaced apart from the support surface (54, 56, 58, 60) and abutting said high-k dielectric layer (62) and said support surface (54, 56, 58, 60), wherein in one embodiment (Figs.1, 2 and 6), said support surface (54, 56, 58, 60) and said conductive layer (64) do not extend into a recess formed in a substrate,

and wherein in a second embodiment (Fig.3, 4) said support surface (54, 56, 58, 60) and said conductive layer (64) extends into a recess formed in the substrate assembly (Dornfest, column 4, line 18 – column 9, line 47).

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to combine the teachings of Takehiro and Dornfest to enable substituting the support substrate of Takehiro with an equivalent support substrate as disclosed in Dornfest, because is prima facie obvious to combine equivalents known for the same purpose (see MPEP 2144.06, I and II), and furthermore, because variations of particular work available in one field of endeavor may be prompted by design incentives and other market forces, either in same field or different one, and if person of ordinary skill in art can implement predictable variation, 35 U.S.C. §103 likely bars its patentability (KSR International Co. v. Teleflex Inc., 82 USPQ2d 1385 (U.S. 2007)).

In reference to claim 2, the combined teachings of Takehiro and Dornfest dislcose wherein said plurality of high-K dielectric layers comprise a first high-k dielectric contacting said support surface (Takehiro, column 7, lines 53 – 65).

In reference to claim 4, the combined teachings of Takehiro and Dornfest disclose wherein said support surface is a capacitor electrode (Takehiro, column 7, lines 30-36).

In reference to claims 5-7, the combined teachings of Takehiro and Dornfest disclose wherein the one of the dielectric layers defines a thickness of, for example, 10 nm and another of the dielectric layers defines a thickness of, for example, 40 nm, and

wherein the invention is not restricted to these examples (Takehiro, column 16, lines 17 – 35).

The combination of Takehiro and Dornfest fail to expressly dislcose wherein said plurality of high-k dielectric layers defines a thickness of at most 200 angstroms; wherein said plurality of high-k dielectric layers comprises a first high-k dielectric layer contacting said support surface and defining a thickness of at least a monolayer; wherein said first high-k dielectric layer defines a thickness of at least 10 angstroms; wherein the plurality of capacitor dielectric layers defines a total thickness that ranges between approximately 50 angstroms and approximately 70 angstroms; wherein each layer of the plurality defines an individual layer thickness that ranges between approximately 10 angstroms and approximately 40 angstroms; and wherein at least a lowest layer of the plurality defines an individual thickness of approximately 20 angstroms.

One of ordinary skill in the art would have been led to the recited dimensions through routine experimentation and optimization to obtain a desired plurality of dielectric layers. Applicant has not disclosed that the dimensions are for a particular unobvious purpose, produce an unexpected result, or are otherwise critical, and it appears prima facie that the process would possess utility using another dimension (Instant specification, page 10, line 13 – page 11, line 4). Indeed, it has been held that mere dimensional limitations are prima facie obvious absent a disclosure that the limitations are for a particular unobvious purpose, produce an unexpected result, or are otherwise critical. See, for example, In re Rose, 220 F.2d 459, 105 USPQ 237 (CCPA)

1955); In re Rinehart, 531 F.2d 1048, 189 USPQ 143 (CCPA 1976); Gardner v. TEC Systems, Inc., 725 F.2d 1338, 220 USPQ 777 (Fed. Cir. 1984), cert. denied, 469 U.S. 830, 225 USPQ 232 (1984); In re Dailey, 357 F.2d 669, 149 USPQ 47 (CCPA 1966). See also MPEP 2144.04(IV)(B).

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to enable the combination of Takehiro and Dornfest to arrive at the claimed invention through routine optimization.

In reference to claim 8,Takehiro discloses a capacitor dielectric including a plurality of high-k dielectric layers (9, 10, 11), wherein said plurality of high-k dielectric layers further includes a first high-k dielectric layer having a first oxygen concentration defined by point A (Takehiro, Fig.4b) and a second high-k dielectric layer having a second oxygen concentration defined by point B (Takehiro, Fig.4b), which is lower than said first oxygen concentration (Takehiro, column 4, lines 46 – 54 and column 6, line 16 – column 8, line 27). Furthermore, Takehiro discloses wherein the plurality of high-k dielectric layer (9, 10, 11) further comprises an oxygen diffusion barrier layer (10) that prevents oxides in a support surface (6) (Takehiro, column 4, lines 45 – 54) and a conductive layer (8) spaced apart from the support surface wherien the first high-k dielectric layer and the second high-k dielectric layer abut the support surface (6) and the conductive layer (8), and wherein the invention may be carried out in any semiconductor device as long as it has a capacitor structure that employs a highly dielectric film as an insulating film (Takehiro, column 16, lines 29 – 35).

Takehiro fails to expressly dislcose wherein the first high-k dielectric layer manifests a greater oxidation than would an equivalent thickness of the second high-k dielectric layer.

Page 7

However, the recitation of "greater oxidation" in claim 8 is seen to be a recitation of a dielectric layer of said plurality of layers having a higher concentration of oxygen with respect to another layer of said plurality. Therefore, Takehiro discloses the claimed limitation because Takehiro discloses an overlying dielectric layer having a lower concentration.

Still, Takehiro fails to disclose wherein the support surface and the conductive layer extend into a recesses formed in the substrate assembly.

However, Dornfest (Figs.1-4 and 6) discloses a substrate assembly including a support surface (54, 56, 58, 60); a high-k dielectric layer (62) over said support surface (54, 56, 68, 60); and a conductive layer (64) spaced apart from the support surface (54, 56, 58, 60) and abutting said high-k dielectric layer (62) and said support surface (54, 56, 58, 60), wherein in one embodiment (Figs.1, 2 and 6), said support surface (54, 56, 58, 60) and said conductive layer (64) do not extend into a recess formed in a substrate, and wherein in a second embodiment (Fig.3, 4) said support surface (54, 56, 58, 60) and said conductive layer (64) extends into a recess formed in the substrate assembly (Dornfest, column 4, line 18 – column 9, line 47).

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to combine the teachings of Takehiro and Dornfest to enable substituting the support substrate of Takehiro with an equivalent support

substrate as disclosed in Dornfest, because is prima facie obvious to combine equivalents known for the same purpose (see MPEP 2144.06, I and II), and furthermore, because variations of particular work available in one field of endeavor may be prompted by design incentives and other market forces, either in same field or different one, and if person of ordinary skill in art can implement predictable variation, 35 U.S.C. §103 likely bars its patentability (KSR International Co. v. Teleflex Inc., 82 USPQ2d 1385 (U.S. 2007)).

In reference to claim 9, the combined teachings of Takehiro and Dornfest disclose wherein said first high-k capacitor dielectric and said second high-k capacitor dielectric have different thicknesses (Takehiro, column 7, line 53 - column 8, line 27).

In reference to claim 10, the combined teachings of Takehiro and Dornfest disclose wherein said first high-k capacitor dielectric and said second high-k capacitor dielectric are oxides (Takehiro, column 7, line 53 - column 8, line 27 and column 15, lines 57 – 67).

In reference to claim 11, the combined teachings of Takehiro and Dornfest disclose wherein said first high-k capacitor dielectric is a first oxide with a first oxygen concentration and wherein said second high-k capacitor dielectric is a second oxide different from said first oxide (Takehiro, Fig. 4). Therefore, since the first and the second layer have different oxygen composition, for purposes of this rejection, this is seen as a first layer being different than a second layer.

In reference to claim 12, Takehiro (Figs.2d, 4a and 4b) discloses a capacitor dielectric (9, 10, 11) comprising a first high-k capacitor dielectric comprising a metallic

Page 9

element and contains a first amount of oxygen per unit volume defined by point A (Takehiro, Fig.4a); a second high-k capacitor dielectric comprising said metallic element and contacting said first high-k capacitor dielectric, wherein said second high-K capacitor dielectric contains a second amount of oxygen per unit volume defined by point B (Takehiro, Fig.4c) different from said first amount, wherein said first high-K capacitor dielectric and said second high-K capacitor dielectric are oxides, wherein said capacitor dielectric (9, 10, 11) further includes a oxygen diffusion barrier layer (10) resulting in a surface of a lower electrode (6) to be free of oxides; and a conductive layer (8) spaced apart form the support surface (6), wherein said capacitor dielectric (9, 10, 11) abut the support surface (6) and the conductive layer (8) and wherein the invention may be carried out in any semiconductor device as long as it has a capacitor structure that employs a highly dielectric film as an insulating film (Takehiro, column 4, lines 46 – 54, column 6, line 16 – column 8, line 27 and column 16, lines 29 – 35).

Takehiro fails to expressly dislcose wherein the first high-k capacitor dielectric manifests a greater oxidation than would an equivalent thickness of the second high-k capacitor dielectric.

However, the recitation of "greater oxidation" is seen to be a recitation of a dielectric layer of said plurality of layers having a higher concentration of oxygen with respect to another layer of said plurality. Therefore, Takehiro teaches the claimed limitation because Takehiro discloses an overlying dielectric layer having a lower concentration.

Art Unit: 2823

Still, Takehiro fails to disclose, wherein the support surface and the conductive layer extend into a recess formed in the substrate assembly.

However, Dornfest (Figs.1-4 and 6) discloses a substrate assembly including a support surface (54, 56, 58, 60); a high-k dielectric layer (62) over said support surface (54, 56, 68, 60); and a conductive layer (64) spaced apart from the support surface (54, 56, 58, 60) and abutting said high-k dielectric layer (62) and said support surface (54, 56, 58, 60), wherein in one embodiment (Figs.1, 2 and 6), said support surface (54, 56, 58, 60) and said conductive layer (64) do not extend into a recess formed in a substrate, and wherein in a second embodiment (Fig.3, 4) said support surface (54, 56, 58, 60) and said conductive layer (64) extends into a recess formed in the substrate assembly (Dornfest, column 4, line 18 – column 9, line 47).

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to combine the teachings of Takehiro and Dornfest to enable substituting the support substrate of Takehiro with an equivalent support substrate as disclosed in Dornfest, because is prima facie obvious to combine equivalents known for the same purpose (see MPEP 2144.06, I and II), and furthermore, because variations of particular work available in one field of endeavor may be prompted by design incentives and other market forces, either in same field or different one, and if person of ordinary skill in art can implement predictable variation, 35 U.S.C. §103 likely bars its patentability (KSR International Co. v. Teleflex Inc., 82 USPQ2d 1385 (U.S. 2007)).

Art Unit: 2823

In reference to claim 13, Takehiro (Figs.2d, 4a and 4b) teaches a capacitor structure, comprising a first electrode layer (6); a dielectric layer (9, 10, 11) disposed over said first electrode layer (6), wherein said dielectric layer (9, 10, 11) comprises a plurality of consecutively-positioned sub-layers, wherein each of said sub-layers comprises a high-dielectric-constant material, wherein said dielectric layer comprises an element common to all sub-layers of said plurality, wherein the dielectric layer (9, 10, 11) further includes a oxygen diffusion barrier layer (10) that prevents oxides to be formed in said first electrode layer (6) wherein one of said sub-layers has more oxygen, defined by point A (Takehiro, Fig.4b) than another of said sublayers defined by point B (Takehiro, Fig.4b); and a second electrode layer (8) disposed over said dielectric layer (9, 10, 11), wherein the invention may be carried out in any semiconductor device as long as it has a capacitor structure that employs a highly dielectric film as an insulating film (Takehiro, column 4, lines 46 – 54, column 6, line 16 – column 8, line 27 and column 16, lines 29 – 35).

Takehiro fails to expressly dislcose wherein one of the sub-layers of the dielectric layer manifests greater oxidation than would an equivalent thickness of an underlying sub-layer of the dielectric layer further

However, the recitation of "greater oxidation" is seen to be a recitation of a dielectric layer of said plurality of layers having a higher concentration of oxygen with respect to another layer of said plurality. Therefore, Takehiro teaches the claimed limitation because Takehiro discloses an overlying dielectric layer having a lower concentration.

Still, Takehiro fails to disclose, wherein the first electrode and the second electrode extend into a recesses formed in the substrate assembly.

However, Dornfest (Figs.1-4 and 6) discloses a substrate assembly including a support surface (54, 56, 58, 60); a high-k dielectric layer (62) over said support surface (54, 56, 68, 60); and a conductive layer (64) spaced apart from the support surface (54, 56, 58, 60) and abutting said high-k dielectric layer (62) and said support surface (54, 56, 58, 60), wherein in one embodiment (Figs.1, 2 and 6), said support surface (54, 56, 58, 60) and said conductive layer (64) do not extend into a recess formed in a substrate, and wherein in a second embodiment (Fig.3, 4) said support surface (54, 56, 58, 60) and said conductive layer (64) extends into a recess formed in the substrate assembly (Dornfest, column 4, line 18 – column 9, line 47).

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to combine the teachings of Takehiro and Dornfest to enable substituting the support substrate of Takehiro with an equivalent support substrate as disclosed in Dornfest, because is prima facie obvious to combine equivalents known for the same purpose (see MPEP 2144.06, I and II), and furthermore, because variations of particular work available in one field of endeavor may be prompted by design incentives and other market forces, either in same field or different one, and if person of ordinary skill in art can implement predictable variation, 35 U.S.C. §103 likely bars its patentability (KSR International Co. v. Teleflex Inc., 82 USPQ2d 1385 (U.S. 2007)).

Art Unit: 2823

In reference to claims 52, 53 and 62, Takehiro (Figs.2d, 4a and 4b) discloses a capacitor structure, including a first electrode (6), a capacitor dielectric and a second electrode (8), wherein said second electrode (8) is spaced apart from the first electrode and said capacitor dielectric abuts said first (6) and second (8) electrode, wherein said capacitor dielectric comprises a plurality of capacitor dielectric layers (9, 10, 11), wherein each layer of said plurality is a high-K dielectric defining an individual thickness, wherein at least one layer of the plurality has a greater concentration of oxygen (Fig.4b, Point A) than an underlying layer (Figs.4b, Point B), and wherein said capacitor dielectric (9, 10, 11) further includes an oxygen barrier layer (10) that prevents oxides from forming in a support surface (6) (Takehiro, column 4, lines 46 – 54 and column 6, line 16 - column 8, line 27). Furthermore, Takehiro discloses wherein the one of the dielectric layers (9) defines a thickness of, for example, 10 nm and another of the dielectric layers (11) defines a thickness of, for example, 40 nm, and wherein the invention is not restricted to these examples (Takehiro, column 16, lines 17 – 35), and wherein the invention may be carried out in any semiconductor device as long as it has a capacitor structure that employs a highly dielectric film as an insulating film (Takehiro, column 16, lines 29 - 35).

Takehiro fails to expressly dislcose wherein at least one layer of the plurality manifests a greater oxidation than would an equal thickness of an underlying layer of the plurality.

However, the recitation of "greater oxidation" is seen to be a recitation of a dielectric layer of said plurality of layers having a higher concentration of oxygen with

Art Unit: 2823

respect to another layer of said plurality. Therefore, Takehiro teaches the claimed limitation because Takehiro discloses an overlying dielectric layer having a lower concentration.

Still, Takehiro fails to disclose, wherein the first and second electrodes extend into a recesses formed in the substrate assembly.

However, Dornfest (Figs.1-4 and 6) discloses a substrate assembly including a first electrode (54, 56, 58, 60); a high-k dielectric layer (62) over said first electrode (54, 56, 68, 60); and a second electrode (64) spaced apart from the first electrode (54, 56, 58, 60) and abutting said high-k dielectric layer (62) and said first electrode (54, 56, 58, 60), wherein in one embodiment (Figs.1, 2 and 6), said first electrode (54, 56, 58, 60) and said second electrode (64) do not extend into a recess formed in a substrate, and wherein in a second embodiment (Fig.3, 4) said first electrode (54, 56, 58, 60) and said second electrode (64) extends into a recess formed in the substrate assembly (Dornfest, column 4, line 18 – column 9, line 47).

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to combine the teachings of Takehiro and Dornfest to enable substituting the support substrate of Takehiro with an equivalent support substrate as disclosed in Dornfest, because is prima facie obvious to combine equivalents known for the same purpose (see MPEP 2144.06, I and II), and furthermore, because variations of particular work available in one field of endeavor may be prompted by design incentives and other market forces, either in same field or different one, and if person of ordinary skill in art can implement predictable variation,

Art Unit: 2823

35 U.S.C. §103 likely bars its patentability (KSR International Co. v. Teleflex Inc., 82 USPQ2d 1385 (U.S. 2007)).

Still, the combination of Takehiro and Dornfest fail to expressly dislose wherein said plurality of capacitor dielectric layers defines a total thickness ranging from 50 to 70 angstroms, wherein each layer of said plurality defines an individual thickness ranging from 10 to 40 angstroms in thickness, and wherein at least a lowest layer of said plurality defines an individual thickness of about 20 angstroms.

One of ordinary skill in the art would have been led to the recited dimensions through routine experimentation and optimization to obtain a desired plurality of dielectric layers. Applicant has not disclosed that the dimensions are for a particular unobvious purpose, produce an unexpected result, or are otherwise critical, and it appears prima facie that the process would possess utility using another dimension (Instant specification, page 10, line 13 – page 11, line 4). Indeed, it has been held that mere dimensional limitations are prima facie obvious absent a disclosure that the limitations are for a particular unobvious purpose, produce an unexpected result, or are otherwise critical. See, for example, In re Rose, 220 F.2d 459, 105 USPQ 237 (CCPA 1955); In re Rinehart, 531 F.2d 1048, 189 USPQ 143 (CCPA 1976); Gardner v. TEC Systems, Inc., 725 F.2d 1338, 220 USPQ 777 (Fed. Cir. 1984), cert. denied, 469 U.S. 830, 225 USPQ 232 (1984); In re Dailey, 357 F.2d 669, 149 USPQ 47 (CCPA 1966). See also MPEP 2144.04(IV)(B).

Art Unit: 2823

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to enable the combination of Takehiro and Dornfest to arrive at the claimed invention through routine optimization.

In reference to claims 60 and 61, the combined teachings of Takehiro and Nishioka disclose wherein the at least two layers of said plurality include barium strontium and titanium (Takehiro, Figs.4a-4b).

In reference to claim 63, Takehiro (Figs.2d, 4a and 4b) discloses a capacitor structure, including a first electrode (6), a capacitor dielectric and a second electrode (8), wherein said second electrode (8) is spaced apart from the first electrode and said capacitor dielectric abuts said first (6) and second (8) electrode, wherein said capacitor structure comprises a plurality of capacitor dielectric layers (9, 10, 11), wherein each layer of the plurality is a high-K dielectric, wherein at least one layer of the plurality has a greater concentration of oxygen (Fig.4b, Point A) than an underlying layer (Figs.4b, Point B), wherein said capacitor dielectric (9, 10, 11) further includes an oxygen barrier layer (10) that prevents oxides from forming in a support surface (6), and wherein the invention may be carried out in any semiconductor device as long as it has a capacitor structure that employs a highly dielectric film as an insulating film (Takehiro, column 4, lines 46 – 54, column 6, line 16 – column 8, line 27 and column 16, lines 29 – 35)

Takehiro fails to expressly dislcose wherein one of the sub-layers of the dielectric layer manifests greater oxidation than would an equivalent thickness of an underlying sub-layer of the dielectric layer further

However, the recitation of "greater oxidation" is seen to be a recitation of a dielectric layer of said plurality of layers having a higher concentration of oxygen with respect to another layer of said plurality. Therefore, Takehiro teaches the claimed limitation because Takehiro discloses an overlying dielectric layer having a lower oxygen concentration.

Still, Takehiro fails to disclose, wherein the first electrode and the second electrode extend into a recesses formed in the substrate assembly.

However, Dornfest (Figs.1-4 and 6) discloses a substrate assembly including a support surface (54, 56, 58, 60); a high-k dielectric layer (62) over said support surface (54, 56, 68, 60); and a conductive layer (64) spaced apart from the support surface (54, 56, 58, 60) and abutting said high-k dielectric layer (62) and said support surface (54, 56, 58, 60), wherein in one embodiment (Figs.1, 2 and 6), said support surface (54, 56, 58, 60) and said conductive layer (64) do not extend into a recess formed in a substrate, and wherein in a second embodiment (Fig.3, 4) said support surface (54, 56, 58, 60) and said conductive layer (64) extends into a recess formed in the substrate assembly (Dornfest, column 4, line 18 – column 9, line 47).

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to combine the teachings of Takehiro and Dornfest to enable substituting the support substrate of Takehiro with an equivalent support substrate as disclosed in Dornfest, because is prima facie obvious to combine equivalents known for the same purpose (see MPEP 2144.06, I and II), and furthermore, because variations of particular work available in one field of endeavor

may be prompted by design incentives and other market forces, either in same field or different one, and if person of ordinary skill in art can implement predictable variation, 35 U.S.C. §103 likely bars its patentability (KSR International Co. v. Teleflex Inc., 82 USPQ2d 1385 (U.S. 2007)).

In reference to claims 64-66, the combination of Takehiro and Dornfest disclose wherein the one of the dielectric layers defines a thickness of, for example, 10 nm and another of the dielectric layers defines a thickness of, for example, 40 nm, and wherein the invention is not restricted to these examples (Takehiro, column 16, lines 17 - 35).

The combination of Takehiro and Dornfest fail to expressly dislcose wherein said plurality of high-k dielectric layers defines a thickness of at most 200 angstroms; wherein said plurality of high-k dielectric layers comprises a first high-k dielectric layer contacting said support surface and defining a thickness of at least a monolayer; wherein said first high-k dielectric layer defines a thickness of at least 10 angstroms; wherein the plurality of capacitor dielectric layers defines a total thickness that ranges between approximately 50 angstroms and approximately 70 angstroms; wherein each layer of the plurality defines an individual layer thickness that ranges between approximately 10 angstroms and approximately 40 angstroms; and wherein at least a lowest layer of the plurality defines an individual thickness of approximately 20 angstroms.

One of ordinary skill in the art would have been led to the recited dimensions through routine experimentation and optimization to obtain a desired plurality of dielectric layers. Applicant has not disclosed that the dimensions are for a particular

Art Unit: 2823

unobvious purpose, produce an unexpected result, or are otherwise critical, and it appears prima facie that the process would possess utility using another dimension (Instant specification, page 10, line 13 – page 11, line 4). Indeed, it has been held that mere dimensional limitations are prima facie obvious absent a disclosure that the limitations are for a particular unobvious purpose, produce an unexpected result, or are otherwise critical. See, for example, In re Rose, 220 F.2d 459, 105 USPQ 237 (CCPA 1955); In re Rinehart, 531 F.2d 1048, 189 USPQ 143 (CCPA 1976); Gardner v. TEC Systems, Inc., 725 F.2d 1338, 220 USPQ 777 (Fed. Cir. 1984), cert. denied, 469 U.S. 830, 225 USPQ 232 (1984); In re Dailey, 357 F.2d 669, 149 USPQ 47 (CCPA 1966). See also MPEP 2144.04(IV)(B).

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to enable the combination of Takehiro and Dornfest to arrive at the claimed invention through routine optimization.

In reference to claim 67, Takehiro (Figs.2d, 4a and 4b) discloses a capacitor structure, including a first electrode (6), a capacitor dielectric and a second electrode (8), wherein said second electrode (8) is spaced apart from the first electrode and said capacitor dielectric abuts said first (6) and second (8) electrode, wherein said capacitor dielectric comprises a plurality of capacitor dielectric layers (9, 10, 11), wherein each layer of the plurality is a high-K dielectric, wherein at least one layer of the plurality has a greater concentration of oxygen (Fig.4b, Point A) than an underlying layer (Figs.4b, Point B), wherein said capacitor dielectric (9, 10, 11) further includes an oxygen barrier layer (10) that prevents oxides from forming in said first electrode (6), and wherein the

Art Unit: 2823

invention may be carried out in any semiconductor device as long as it has a capacitor structure that employs a highly dielectric film as an insulating film (Takehiro, column 4, lines 46 – 54, column 6, line 16 – column 8, line 27 and column 16, lines 29 – 35)

Takehiro fails to expressly dislcose wherein at least one layer of the plurality manifests a greater oxidation than would an equal thickness of an underlying layer of the plurality.

However, the recitation of "greater oxidation" is seen to be a recitation of a dielectric layer of said plurality of layers having a higher concentration of oxygen with respect to another layer of said plurality. Therefore, Takehiro teaches the claimed limitation because Takehiro discloses an overlying dielectric layer having a lower concentration.

Still, Takehiro fails to disclose wherein the first and second electrodes extend into a recesses formed in the substrate assembly.

However, Dornfest (Figs.1-4 and 6) discloses a substrate assembly including a support surface (54, 56, 58, 60); a high-k dielectric layer (62) over said support surface (54, 56, 68, 60); and a conductive layer (64) spaced apart from the support surface (54, 56, 58, 60) and abutting said high-k dielectric layer (62) and said support surface (54, 56, 58, 60), wherein in one embodiment (Figs.1, 2 and 6), said support surface (54, 56, 58, 60) and said conductive layer (64) do not extend into a recess formed in a substrate, and wherein in a second embodiment (Fig.3, 4) said support surface (54, 56, 58, 60) and said conductive layer (64) extends into a recess formed in the substrate assembly (Dornfest, column 4, line 18 – column 9, line 47).

Art Unit: 2823

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to combine the teachings of Takehiro and Dornfest to enable substituting the support substrate of Takehiro with an equivalent support substrate as disclosed in Dornfest, because is prima facie obvious to combine equivalents known for the same purpose (see MPEP 2144.06, I and II), and furthermore, because variations of particular work available in one field of endeavor may be prompted by design incentives and other market forces, either in same field or different one, and if person of ordinary skill in art can implement predictable variation, 35 U.S.C. §103 likely bars its patentability (KSR International Co. v. Teleflex Inc., 82 USPQ2d 1385 (U.S. 2007)).

In reference to claims 68-70, the combination of Takehiro and Dornfest disclose wherein the one of the dielectric layers defines a thickness of, for example, 10 nm and another of the dielectric layers defines a thickness of, for example, 40 nm, and wherein the invention is not restricted to these examples (Takehiro, column 16, lines 17 - 35).

The combination of Takehiro and Dornfest fail to expressly dislose wherein said plurality of high-k dielectric layers defines a thickness of at most 200 angstroms; wherein said plurality of high-k dielectric layers comprises a first high-k dielectric layer contacting said support surface and defining a thickness of at least a monolayer; wherein said first high-k dielectric layer defines a thickness of at least 10 angstroms; wherein the plurality of capacitor dielectric layers defines a total thickness that ranges between approximately 50 angstroms and approximately 70 angstroms; wherein each layer of the plurality defines an individual layer thickness that ranges between

Art Unit: 2823

approximately 10 angstroms and approximately 40 angstroms; and wherein at least a lowest layer of the plurality defines an individual thickness of approximately 20 angstroms.

One of ordinary skill in the art would have been led to the recited dimensions through routine experimentation and optimization to obtain a desired plurality of dielectric layers. Applicant has not disclosed that the dimensions are for a particular unobvious purpose, produce an unexpected result, or are otherwise critical, and it appears prima facie that the process would possess utility using another dimension (Instant specification, page 10, line 13 – page 11, line 4). Indeed, it has been held that mere dimensional limitations are prima facie obvious absent a disclosure that the limitations are for a particular unobvious purpose, produce an unexpected result, or are otherwise critical. See, for example, In re Rose, 220 F.2d 459, 105 USPQ 237 (CCPA 1955); In re Rinehart, 531 F.2d 1048, 189 USPQ 143 (CCPA 1976); Gardner v. TEC Systems, Inc., 725 F.2d 1338, 220 USPQ 777 (Fed. Cir. 1984), cert. denied, 469 U.S. 830, 225 USPQ 232 (1984); In re Dailey, 357 F.2d 669, 149 USPQ 47 (CCPA 1966). See also MPEP 2144.04(IV)(B).

Therefore, it would have been obvious to one of ordinary skill in the art at the time the invention was made to enable the combination of Takehiro and Dornfest to arrive at the claimed invention through routine optimization.

Response to Arguments

4. Applicant's arguments with respect to claims 1-13, 52, 53 and 60-70 have been considered but are moot in view of the new ground(s) of rejection.

Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to JULIO J. MALDONADO whose telephone number is (571)272-1864. The examiner can normally be reached on Mon-Fri, 8:00 A.M.-4:00 P.M..

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Matthew Smith can be reached on (571)-272-1907. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
